

NAME

preset-update – update the format of a saved GMA map file

SYNOPSIS

(If using the full GMA core tool suite)

gma go preset-update [*file* ...]

(Otherwise)

preset-update [*file* ...]

DESCRIPTION

Preset-update reads each *file* named on the command line and rewrites the file in the current die-roll preset file format. A copy of the original is kept with the same name plus a **.bak** suffix.

If no files are named, **preset-update** reads from its standard input and writes to its standard output.

The file format changed significantly between format versions 1 and 2. The **preset-update** program can read format 1 files, so this provides a way to update existing map files to the newer format.

SEE ALSO

dice(5), **gma**(6).
